To do

- Reporting section has complex backend development that involves using historical data to calculate and generate relevant recruitment metrics
    - Data Aggregation and Processing: Need to use efficient data pipelines and ETL processes to collect,clean, and transform raw data into usable format for analysis.
    - Statistical Analysis and Modeling: Utilize statistical libraries like NumPy and Pandas in Python or R for performing data analysis, hypothesis testing, regression analysis, and predictive modeling
    - Metric Definition and Calculation: Define the metrics, establish calculation methodologies, and implement the necessary logic in the backend code. Document the metric definitions and calculation processes for transparency and reproducibility.
